# The longtable package\*

#### David Carlisle<sup>†</sup>

#### 1996/05/24

#### Abstract

This package defines the longtable environment, a multi-page version of tabular.

#### **List of Tables**

1	An optional table caption (used in the list of tables)
2	A floating table
3	A difficult \multicolumn combination: pass 1
4	A difficult \multicolumn combination: pass 2
5	A difficult \multicolumn combination: pass 3
6	A difficult \multicolumn combination: pass 4
7	A summary of longtable commands

## 1 Introduction

longtable

The longtable package defines a new environment, longtable, which has most of the features of the tabular environment, but produces tables which may be broken by TEX's standard page-breaking algorithm. It also shares some features with the table environment. In particular it uses the same counter, table, and has a similar \caption command. Also, the standard \listoftables command lists tables produced by either the table or longtable environments.

The following example uses most of the features of the longtable environment. An edited listing of the input for this example appears in Section 8.

**Note:** Various parts of the following table will **not** line up correctly until this document has been run through LATEX several times. This is a characteristic feature of this package, as described below.

Table 1: A long table

*	This part appears at the top of the table		
*	FIRST	SECOND	*
*	longtable columns are specified	in the	*
*	This goes at the	bottom.	*

<sup>\*</sup>This file has version number v4.04, last revised 1996/05/24.

Page 1	
 rage 1	

<sup>†</sup>The new algorithm for aligning 'chunks' of a table used in version 4 of this package was devised coded and documented by David Kastrup, dak@pool.informatik.rwth-aachen.de.

Table 1: (continued)

*	This part appears at the top of every of	ther page	*
*	First	Second	*
*	same way as in the tabular	environment.	*
*	@{*}r  p{1in}@{*}	in this case.	*
*	Each row ends with a	\\ command.	*

Lots of filles	like this.	* *
Lots of fines	like this.	*
These filles will	appear	*
* in place of the	usual foot	-
* at the end	of the table	*

### 2 Chunk Size

LTchunksize

In order to TeX multi-page tables, it is necessary to break up the table into smaller chunks, so that TeX does not have to keep everything in memory at one time. By default longtable uses 20 rows per chunk, but this can be set by the user, with e.g., \setcounter{LTchunksize}{10}. These chunks do not affect page breaking, thus if you are using a TeX with a lot of memory, you can set LTchunksize to be several pages of the table. TeX will run faster with a large LTchunksize. However, if necessary, longtable can work with LTchunksize set to 1, in which case the memory taken up is negligible. Note that if you use the commands for setting the table head or

 $<sup>^3</sup>You$  can also use the plain TeX syntax \LTchunksize=10 .

<sup>&</sup>lt;sup>1</sup>This is a footnote.

<sup>&</sup>lt;sup>2</sup>longtable takes special precautions, so that footnotes may also be used in 'p' columns.

1 1-1	
longtable.sty	

A	tabular	environment
within	a floating	table

Table 2: A floating table

foot (see below), the LTchunksize must be at least as large as the number of rows in each of the head or foot sections.

This document specifies \setcounter{LTchunksize}{10}. If you look at the previous table, after the *first* run of LaTeX you will see that various parts of the table do not line up. LaTeX will also have printed a warning that the column widths had changed. longtable writes information onto the .aux file, so that it can line up the different chunks. Prior to version 4 of this package, this information was not used unless a \setlongtables command was issued, however, now the information is always used, using a new algorithm<sup>4</sup> and so \setlongtables is no longer needed. It is defined (but does nothing) for the benefit of old documents that use it.

## 3 Captions and Headings

\endhead \endfirsthead

\endfoot \endlastfoot

\caption

At the start of the table one may specify lines which are to appear at the top of every page (under the headline, but before the other lines of the table). The lines are entered as normal, but the last \\ command is replaced by a \endhead command. If the first page should have a different heading, then this should be entered in the same way, and terminated with the \endfirsthead command. The LTchunksize should be at least as large as the number of rows in the heading. There are also \endfoot and \endlastfoot commands which are used in the same way (at the *start* of the table) to specify rows (or an \hline) to appear at the bottom of each page. In certain situations, you may want to place lines which logically belong in the table body at the end of the firsthead, or the beginning of the lastfoot. This helps to control which lines appear on the first and last page of the table.

The  $\operatorname{caption}\{\ldots\}$  command is essentially equivalent to  $\operatorname{multicolumn}\{n\}\{c\}\{\operatorname{parbox}\{\operatorname{LTcapwidth}\}\{\ldots\}\}$  where n is the number of columns of the table. You may set the width of the caption with a command such as  $\operatorname{setlength}\{\operatorname{LTcapwidth}\}\{2in\}$  in the preamble of your document. The default is 4in.  $\operatorname{caption}$  also writes the information to produce an entry in the list of tables. As with the  $\operatorname{caption}$  command in the figure and table environments, an optional argument specifies the text to appear in the list of tables if this is different from the text to appear in the caption. Thus the caption for table 1 was specified as  $\operatorname{caption}[An \text{ optional table caption (used in the list of tables)}]\{A \text{ long table}\{long}\}$ .

You may wish the caption on later pages to be different to that on the first page. In this case put the \caption command in the first heading, and put a subsidiary caption in a \caption[] command in the main heading. If the optional argument to \caption is empty, no entry is made in the list of tables. Alternatively, if you do not want the table number to be printed each time, use the \caption\* command.

The captions are set based on the code for the article class. If you have redefined the standard \@makecaption command to produce a different format for the captions, you

<sup>&</sup>lt;sup>4</sup>Due to David Kastrup.

may need to make similar changes to the longtable version, \LT@makecaption. See the code section for more details.

A more convenient method of customising captions is given by the caption(2) package, which provides commands for customising captions, and arranges that the captions in standard environments, and many environments provided by packages (including longtable) are modified in a compatible manner.

You may use the \label command so that you can cross reference longtables with \ref. Note however, that the \label command should not be used in a heading that may appear more than once. Place it either in the firsthead, or in the body of the table. It should not be the *first* command in any entry.

#### 4 Multicolumn entries

The \multicolumn command may be used in longtable in exactly the same way as for tabular. So you may want to skip this section, which is rather technical, however coping with \multicolumn is one of the main problems for an environment such as longtable. The main effect that a user will see is that certain combinations of \multicolumn entries will result in a document needing more runs of LATEX before the various 'chunks' of a table align.

The examples in this section are set with LTchunksize set to the minimum value of one, to demonstrate the effects when \multicolumn entries occur in different chunks.

Consider Table 3. In the second chunk, longtable sees the wide multicolumn entry. At this point it thinks that the first two columns are very narrow. All the width of the multicolumn entry is assumed to be in the third column. (This is a 'feature' of TEX's primitive \halign command.) longtable then passes the information that there is a wide third column to the later chunks, with the result that the first pass over the table is too wide.

If the 'saved row' from this first pass was re-inserted into the table on the next pass, the table would line up in two passes, but would be much two wide.

The solution to this problem used in Versions 1 and 2, was to use a \kill line. If a line is \killed, by using \kill rather than \\ at the end of the line, it is used in calculating column widths, but removed from the final table. Thus entering \killed copies of the last two rows before the wide multicolumn entry would mean that \halign 'saw' the wide entries in the first two columns, and so would not widen the third column

by so much to make room for the multicolumn entry.

In Version 3, a new solution was introduced. If the saved row in the .aux file was not being used, longtable used a special 'draft' form of \multicolumn, this modified the definition, so the spanning entry was never considered to be wider than the columns it spanned. So after the first pass, the .aux file stored the widest normal entry for each column, no column was widened due to \spanned columns. By default longtable ignored the .aux file, and so each run of LATEX was considered a first pass. Once the \setlongtables declaration was given, the saved row in the .aux file, and the proper definition of \multicolumn were used. If any \multicolumn entry caused one of the columns to be widened, this information could not be passed back to earlier chunks, and so the table would not correctly line up until the third pass. This algorithm always converged in three passes as described above, but in examples such as the ones in Tables 3–6, the final widths were not optimal as the width of column 2, which is determined by a \multicolumn entry was not known when the final width for column 3 was fixed, due to the fact that both \multicolumn commands were switched

..... Page 5......

\kill

Table 3: A difficult  $\mbox{\mbox{multicolumn}}$  combination: pass 1

1 2	_				
wide mu	ılticolumn	spanning	g 1–3		
multicol	umn 1–2		3		
wide 1	2			3	•

Table 6: A difficult \multicolumn combination: pass 4

1	2	3			
wide mu	wide multicolumn spanning 1–3				
multicolumn 1–2   3					
wide 1	2	3			

..... Page 6 .....

from 'draft' mode to 'normal' mode at the same time.

Version 4 alleviates the problem considerably. The first pass of the table will indeed have the third column much too wide. However, on the next pass longtable will notice the error and reduce the column width accordingly. If this has to propagate to chunks before the \multicolumn one, an additional pass will, of course, be needed. It is possible to construct tables where this rippling up of the correct widths taks several passes to 'converge' and produce a table with all chunks aligned. However in order to need many passes one needs to construct a table with many overlapping \multicolumn entries, all being wider than the natural widths of the columns they span, and all occuring in different chunks. In the typical case the algorithm will converge after three or four passes, and, the benefits of not needing to edit the document before the final run to add \setlongtables, and the better choice of final column widths in the case of multiple \multicolumn entries will hopefully more than pay for the extra passes that may possibly be needed.

So Table 3 converges after 4 passes, as seen in Table 6.

You can still speed the convergence by introducing judicious \kill lines, if you happen to have constellations like the above.

If you object even to LATEX-ing a file twice, you should make the first line of every longtable a \kill line that contains the widest entry to be used in each column. All chunks will then line up on the first pass.

## 5 Adjustment

The optional argument argument of longtable controls the horizontal alignment of the table. The possible options are [c], [r] and [l], for centring, right and left adjustment, respectively. Normally centring is the default, but this document specifies

```
\LTleft
\LTright
```

```
\setlength\LTleft\parindent \setlength\LTright\fill
```

in the preamble, which means that the tables are set flush left, but indented by the usual paragraph indentation. Any lengths can be specified for these two parameters, but at least one of them should be a rubber length so that it fills up the width of the page, unless rubber lengths are added between the columns using the \extracolsep command. For instance

produces a full width table, to get a similar effect with longtable specify

```
\setlength\LTleft{0pt}
\setlength\LTright{0pt}
\begin{longtable}{@{\extracolsep{...}}...}
```

## 6 Changes

This section highlights the major changes since version 2. A more detailed change log may be produced at the end of the code listing if the ltxdoc.cfg file specifies

```
\AtBeginDocument {\RecordChanges}
\AtEndDocument {\PrintChanges}
......Page 7.....
```

 longtable sty	

Changes made between versions 2 and 3.

- The mechanism for adding the head and foot of the table has been completely rewritten. With this new mechanism, longtable does not need to issue a \clearpage at the start of the table, and so the table may start half way down a page. Also the \endlastfoot command which could not safely be implemented under the old scheme, has been added.
- longtable now issues an error if started in the scope of \twocolumn, or the multicols environment.
- The separate documentation file longtable.tex has been merged with the package file, longtable.dtx using Mittelbach's doc package.
- Support for footnotes has been added. Note however that \footnote will not work in the 'head' or 'foot' sections of the table. In order to put a footnote in those sections (e.g., inside a caption), use \footnotemark at that point, and \footnotetext anywhere in the table *body* that will fall on the same page.
- The treatment of \multicolumn has changed, making \kill lines unnecessary, at the price of sometimes requiring a third pass through LATEX.
- The \newpage command now works inside a longtable.

Changes made between versions 3 and 4.

- A new algorithm is used for aligning chunks. As well as the widest width in each column, longtable remembers which chunk produced this maximum. This allows it to check that the maximum is still achieved in later runs. As longtable can now deal with columns shrinking as the file is edited, the \setlongtables system is no longer needed and is disabled.
- An extra benefit of the new algorithm's ability to deal with 'shrinking' columns
  is that it can give better (narrower) column widths in the case of overlapping
  \multicolumn entries in different chunks than the previous algorithm produced.
- The 'draft' multicolumn system has been removed, along with related commands such as \LTmulticolumn.
- The disadvantage of the new algorithm is that it can take more passes. The theoretical maximum is approximately twice the length of a 'chain' of columns with overlapping \multicolumn entries, although in practice it usually converges as fast as the old version. (Which always converged in three passes once \setlongtables was activated.)

 Page 8	

# 7 Summary

Table 7: A summary of longtable commands

Parameters				
\LTleft	Glue to the left of the table.	(\fill)		
\LTright	Glue to the right of the table.	(\fill)		
\LTpre	Glue before the table.	(\bigskipamount)		
\LTpost	Glue after the table.	(\bigskipamount)		
\LTcapwidth	The width of a parbox containing the caption.	(4in)		
LTchunksize	The number of rows per chunk.	(20)		
Setlongtables				
\setlongtables	Use column widths from the previous run.			
<pre>Optional arguments to \begin{longtable}</pre>				
none	Position as specified by \LTleft and \LTri	ght.		
[c]	Centre the table.			
[1]	Place the table flush left.			
[r]	Place the table flush right.			
	Commands to end table rows			
\\	Specifies the end of a row.			
\tabularnewline	Alternative to \\ for use in the scope of \raggedright and similar			
	commands that redefine \\.			
\kill	Row is 'killed', but is used in calculating widths.			
\endhead	Specifies rows to appear at the top of every page.			
\endfirsthead	Specifies rows to appear at the top the first page.			
\endfoot	Specifies rows to appear at the bottom of every page.			
\endlastfoot	Specifies rows to appear at the bottom of the last page.			
longtable caption commands				
\caption{foo}	Caption 'Table ?: foo', and a 'foo' entry in the			
\caption[bar]{foo}	Caption 'Table ?: foo', and a 'bar' entry in the list of tables.			
\caption[]{foo}	Caption 'Table ?: foo', but no entry in the list of	of tables.		
\caption*{foo}	Caption 'foo', but no entry in the list of tables.			
Other commands available inside longtable				
\newpage	Force a page break.			
\footnote	Footnotes, but may not be used in the table head & foot.			
\footnotemark	Footnotemark, May be used in the table head & foot.			
\footnotetext	Footnote text, Use in the table body.			

..... Page 9 ......

```

..... Page 11 ............

```
.....longtable.sty ..............
\c@LTchunksize Added in V3.07 to allow the LATEX syntax \setcounter {LTchunksize} {10}.
                 21 \let\c@LTchunksize\LTchunksize
   \LTcapwidth Width of the \parbox containing the caption. Default 4in.
                 22 \newdimen\LTcapwidth \LTcapwidth=4in
                 9.4 Internal Parameters
      \LT@head Boxes for the table head and foot.
 \LT@firsthead
                 23 \newbox\LT@head
      \LT@foot 24\newbox\LT@firsthead
 \LT@lastfoot 25 \newbox\LT@foot
                 26 \newbox\LT@lastfoot
      \LT@cols Counter for number of columns.
                 27 \newcount\LT@cols
      \LT@rows Counter for rows up to chunksize.
                 28 \newcount\LT@rows
                Counter for the tables, added in V3.02. Previous versions just used the LATEX counter
  \c@LT@tables
                 table, but this fails if table is reset during a document, eg report class resets it every
                 chapter.
                    This was changed from \newcount\LT@tables in V3.04. LATEX counters are
                 preserved correctly when \includeonly is used. In the rest of the file \LT@tables
                 has been replaced by \c@LT@tables without further comment.
                 29 \newcounter{LT@tables}
                We need to count through the chunks of our tables from Version 4 on.
  \c@LT@chunks
                 30 \newcounter{LT@chunks}[LT@tables]
      \c@table If the table counter is not defined (eg in letter style), define it. (Added in V3.06.)
   \fnum@table
                 31 \ifx\c@table\undefined
    \tablename
                 32 \newcounter{table}
                 33 \def\fnum@table{\tablename~\thetable}
                 34\fi
                 35 \ifx\tablename\undefined
                 36 \def\tablename{Table}
                 37 \fi
                In a normal style, longtable uses the .aux file to record the column widths. With
                 letter.sty, use a separate .1ta file. (Added in V3.06.)
                    Not needed for new letter class.

148 \fi
```

Force one more go with the longtable output routine.

```
149 \endgraf\penalty -\LT@end@pen
```

Now close the group to return to the standard routine.

```
50 \endgroup
```

Reset \@mparbottom to allow marginpars close to the end of the table.<sup>5</sup>

```
151 \global\@mparbottom\z@
152 \pagegoal\vsize
153 \endgraf\penalty\z@\addvspace\LTpost
```

Footnotes. As done in the multicol package.

```
154 \ifvoid\footins\else\insert\footins{}\fi}
```

..... Page 16 ......

<sup>&</sup>lt;sup>5</sup>This can not be the correct. However if it is omitted, there is a problem with marginpars, for example on page 3 of this document. Any Output Routine Gurus out there?

	longtable.sty
	9.6 Counting Columns
	Columns are counted by examining \@preamble, rather than simply getting \@mkpream to increment the counter as it builds the preamble so that this package works with many of the packages which add extra column specifiers to LATEX's standard ones.  Version 1 counted \@sharp's to calculate the number of columns, this was changed for Version 2 as it does not work with the NFSS. Now count &'s. (lfonts.new (and now the Standard LATEX definition) defines \@tabclassz so that \@sharp is inside a group.)
\LT@nofcols	Find the next &, then look ahead to see what is next.  155 \def\LT@nofcols#1&{%  156 \futurelet\@let@token\LT@n@fcols}
\LT@n@fcols	Add one, then stop at an \LT@nofcols or look for the next &. The \expandafter trick was added in Version 3, also the name changed from \@LT@nofcols to preserve the \LT@ naming convention.  157 \def\LT@n@fcols {% 158 \advance\LT@cols\@ne 159 \ifx\@let@token\LT@nofcols 160 \expandafter\@gobble 161 \else 162 \expandafter\LT@nofcols 163 \fi}

                   211
                   To write an entry for the aux file, we use a slightly surprising definition which has the
\LT@entry@write
                   sole purpose of avoiding overfull lines (which might break TEX's limits when reading
                   the aux file, probably you'd need to have a few hundred columns before this happened
                   but...).
                   212 \def\LT@entry@write{%
                        \@percentchar^^J\@spaces
                        \noexpand\LT@entry}
                   This ends the current chunk as above, but strips off two rows, the 'dummy row' and the
        \LT@kill
                   'killed row' before starting the next chunk. Since V3.04, the old chunk is reboxed at the
                   start of the box containing the next chunk. This allows \kill to be used in headers,
                   which must be processed in a single box.
                   215 \def\LT@kill{%
                        \LT@echunk

                   9.8
                         The Dummy Row
                   The dummy row is kept inside of the macro \LT@save@row.
                   Create a blank row if we are not using the info in the .aux file.
  \LT@blank@row
\LT@build@blank
                   224 \def\LT@blank@row{%
                        \xdef\LT@save@row{\expandafter\LT@build@blank
                          \romannumeral\number\LT@cols 001 }}
                   Whoops! What's that supposed to be? A drop-in replacement for the first task of Ap-
                   pendix D in the TrXbook. The \romannumeral produces \LT@cols instances of m
                   followed by i. The below macro then replaces the ms by appropriate entries.
                   227 \def\LT@build@blank#1{%
                        \if#1m%
                          \noexpand\LT@entry{1}{0pt}%
                   229
                          \expandafter\LT@build@blank
                   230
                   231
                        \fi}
   \LT@make@row
                   Prior to version 4, by default did not use information in the .aux file but now we can
                   define \LT@make@row to use the .aux file, even on the 'draft' passes.
                   232 \def\LT@make@row{%
                        \global\expandafter\let\expandafter\LT@save@row
                          \csname LT@\romannumeral\c@LT@tables\endcsname
                   235
                        \ifx\LT@save@row\relax
                   236
                          \LT@blank@row
```

..... Page 19 .....

```
.....longtable.sty ......
```

Now a slightly difficult part comes. Before we decide making the template from the .aux file info we check that the number of fields has remained the same. If it hasn't, either the table format has changed, or we have the wrong table altogether. In both cases, we decide to better drop all gathered information and start over.

The expansion between !...! below will be empty if the number of \LT@entry macros including arguments in \LT@save@row is equal to \LT@cols. If it is not empty, we throw the row away and start from scratch.

```
\else
238
      {\let\LT@entry\or
239
        \if!%
240
            \ifcase\expandafter\expandafter\LT@cols
241
            \expandafter\@gobble\LT@save@row
242
243
            \else
244
              \relax
245
            \fi
           ! %
246
        \else
247
248
          \aftergroup\LT@blank@row
249
        \fi}%
    \fi}
```

\setlongtables

Redefine  $\LT@make@row$  to use information in the .aux file, if there is a saved row for this table with the right number of columns.

Since Version 3.02, longtable has used the internal counter \c@LT@tables rather than the LATeX counter table. The warning message was added at V3.04, as was the \global, to stop save-stack overflow.

Since Version 4.01 \setlongtables does nothing as it is not needed, but is defined as \relax for the benefit of old documents.

```
251 \let\setlongtables\relax
```

\LT@get@widths

This is the heart of longtable. If it were not for the table head and foot, this macro together with the modified \\ command would form the basis of quite a simple little package file for long tables. It is closely modelled on the \endvrulealign macro of appendix D of the TeXbook.

```
252 \def\LT@get@widths{%
```

\global added at V3.04, to stop save-stack overflow.

Loop through the last row, discarding glue, and saving box widths. At V3.04 changed the scratch box to 2, as the new \kill requires that \box0 be preserved.

```
\setbox\tw@\hbox{%
253
254
       \unhbox\@ne
255
       \let\LT@old@row\LT@save@row
       \global\let\LT@save@row\@empty
256
257
       \count@\LT@cols
258
       \loop
         \unskip
259
260
         \setbox\tw@\lastbox
       \ifhbox\tw@
261
         \LT@def@row
262
         \advance\count@\m@ne
263
264
       \repeat}%
```

..... Page 20 .....

```
.....longtable.sty ......
```

Remember the widths if we are in the first chunk.

```
265 \ifx\LT@@save@row\@undefined
266 \let\LT@@save@row\LT@save@row
267 \fi}
```

\LT@def@row

Add a column to the dummy row. Name changed from \defLT@save@row in Version 3, to preserve the \LT@ naming convention.

```
268 \def\LT@def@row{%
```

We start by picking the respective entry from our old row. These redefinitions of \LT@entry are local to the group started in \LT@get@widths.

```
269 \let\LT@entry\or
270 \edef\@tempa{%
271 \ifcase\expandafter\count@\LT@old@row
272 \else
273 \{1\{0pt\}%
274 \fi\}%
```

Now we tack the right combination in front of \LT@save@row:

```
275 \let\LT@entry\relax
276 \xdef\LT@save@row{%
277 \LT@entry
278 \expandafter\LT@max@sel\@tempa
279 \LT@save@row}}
```

\LT@max@sel

And this is how to select the right combination. Note that we take the old maximum information only if the size does not change in *either* direction. If the size has grown, we of course have a new maximum. If the size has shrunk, the old maximum (which was explicitly not enforced because of being in the current chunk) is invalid, and we start with this chunk as the new size. Note that even in the case of equality we *must* use the \the\wd\tw@ construct instead of #2 because #2 might be read in from the file, and so could have \catcode 11 versions of p and t in it which we want to be replaced by their 'proper' \catcode 12 versions.

```
280 \def\LT@max@sel#1#2{%
281 {\ifdim#2=\wd\tw@
282 #1%
283 \else
284 \number\c@LT@chunks
285 \fi}%
286 {\the\wd\tw@}}
```

#### 9.9 The \hline Command

\LT@hline

\hline and \hline\hline both produce *two* lines. The only difference being the glue and penalties between them. This is so that a page break at a \hline produces a line on both pages. Also this \hline is more like a \cline{1-\LT@cols}. tabular's \hline would draw lines the full width of the page.

```
287 \def\LT@hline{%
288 \noalign{\ifnum0='}\fi
289 \penalty\@M
290 \futurelet\@let@token\LT@@hline}
```

..... Page 21 ......

<sup>&</sup>lt;sup>6</sup>longtable has always done this, but perhaps it would be better if hlines were *omitted* at a page break, as the head and foot usually put a hline here anyway.

```
.....longtable.sty .......
                                    This code is based on \cline. Two copies of the line are produced, as described above.
          \LT@@hline
                                    291 \def\LT@@hline{%
                                             \ifx\@let@token\hline
                                                  \global\let\@gtempa\@gobble

                 9.13
                       The \multicolumn command
                 Earlier versions needed a special 'draft' form of \multicolumn. This is not needed in
                 version 4, and so these commands have been removed.
\LTmulticolumn
    \LT@mcwarn
                 9.14 Footnotes
                 The standard \footnote command works in a c column, but we need to modify the
                 definition in a p column to overcome the extra level of boxing. These macros are based
                 on the array package, but should be OK for the standard tabular.
 \LT@startpbox Add extra code to switch the definition of \@footnotetext.
                 373 \def\LT@startpbox#1{%
                     \bgroup
                       \let\@footnotetext\LT@p@ftntext
